

# ENZFELDER GMbH

# Power transmission and lifting engineering

Spindle gear cubic
Type BG

### **History**

**1969** Mr. Enzfelder established a job shop in Vienna. Equipped with some machinery, the Enzfelder Company manufactured machine parts according to drawings.

Within one year the number of employees rose to 3. The Enzfelder company started manufacturing threaded spindles and nuts according to drawings. Then the range of manufacturing was enlarged by toothed wheels, screw wheels and endless screws according to drawings.

**1974** The company including the complete manufacture was relocated to Enzesfeld.

**1975** The manufacture of spindle gears was launched. The company's experience in the manufacture of trapezoid-threaded spindles, nuts, worm gear pairs and casings was a valuable basis for the construction. After many tests, the serial production of spindle gears was launched one year later. The result was a product characterized by a first-rate price-performance ratio. The product was distributed by dealers all over Europe.

**1981** The planning and construction of small hydropower plants was launched to replace diesel generators. Environmental protection was not really a topic at that time, however, and the production was stopped in 1986.

**1989** The Enzfelder GesmbH company replaced the Franz Enzfelder Company.

**1990** Scissor-type lifting platforms and cable winches were added to the delivery program.

**1991** Resilient spacer shafts were tested and added to the production range. At the same time, the telescopic spindle gear was developed. A patent for this principle was applied for and issued.

**1993** The sale of spindle gears under their own name was launched and presented for the first time at the Hannover industrial fair. We have been approached with a variety of tasks and have provided solutions according to the customers' needs ever since.

**1994** In cooperation with our customers we produced the first bevel gears to specification.

**1995** Spindle bearing arrangements were designed and included in the standard program.

**1996** The Enzfelder company produced planet gear to specification for the first time.

**1998-1999** The standard programs were enlarged. Additionally, bevel gears are manufactured in a standard design.

**2000** The development of electric cylinders in standard design for very high loads (5-1000kN) was started. At the same time the telescopic spindle gears were refined to save the customer the guiding and locking devices. Since that time we have been able to offer telescopic cylinders, too.

**2001** The development of electric cylinders was completed, and these cylinders were added to the standard program.

At the same time the development and fabrication of cubic spindle gears for lifting loads between 2.5 and 150kN was started. These gears were added to the standard program as well.

**2002** were extended and optimized the series of the electric cylinders. Further we provide an electronic 2D-3D product catalogue of the spindle gears, it makes it possible to integrate our products into your system.

2002-2003 We putted our new assembling and packaging hall, beside the manufacturing hall, in operation

**2003** We increased our machinery by buying a CNC machine tool with 7 axes, brand AXA. That new CNC machine allows a precise machining of the screw jack housings in only two clamping.

**2003-2004** The engineering started to use new 3-D CAD software, Solid Edge. That software enables our customers to integrate easily our drawings.

**2004** We opened a sales office in France.

**2004-2005** We started to design the high performance screw jacks HSG and we created a range of 10 different sizes

**2005** First participation to an exhibition in France: INDUSTRIE 2005 at Lyon.

**2005-2006** We started to design a new range of telescopic screw jacks TSGLR. Today, these new telescopic screw jacks, with a more compact design, are used in the stage industry, in the aircraft industry, on train lifting equipments and in machine building.

2008 We replaced the tread grinding machine by a new CNC thread grinding machine, brand Mikromat.

In the past years we solved problems of motive power engineering and lifting for our customers. We searched and found the optimal solution for each case and manufactured at the best possible price/performance ratio.

Figirutage correct selection of spindle gears the following datakare of decisive importance:

2.) lifting speed

3.) operating cycle

4.) spindle length (buckling)5.) tensile- or pressure load6.) ambient temperature

7.) fitting length (please indicate when ordering)

8.) critical speed of the spindle

[m/min]

[%/10min] [%/hour]

[mm] [kN] [°C]

[mm] If you use the questionnaire on page 17 please provide the data available. [min-1]

How to proceed in the selection: on the basis of the desired load data (in kN) a suitable type of gear is selected from the preselection table below.

| Sizes  | tated power kN | tated power in KN<br>by ball bearing spindle | gearbox material |    | size of spindle | size of<br>ball bearing spindle |                 | ngal reduction | length of stroke | per rotation in mm | length of stroke<br>per rotation in mm<br>by ball bearing spindle | efficiency | %<br>.⊑ | efficiency in %<br>by ball bearing spindle | max. driving power<br>duty cycle 20%/h<br>in KW | max. driving power<br>duty cycle 10%/h<br>in KW | weight in kg<br>excl. lifting element | weight in kg per<br>100mm strake |

Read off the dimensioned sketch and the performance table on the corresponding page of the catalog:

- 1.) whether the dimensions of gear and spindle fit into your system.
  2.) which gear reduction must be selected for the desired lifting speed
  - (for higher lifting speeds the use of a double-thread spindle may be necessary).
- 3.) whether the power required for the desired lifting speed is admissible.

- 4.) whether under pressure load the critical buckling force is not exceeded.
  5.) whether the critical revolutions/min of the spindle are not exceeded.
  6.) If one of these requirements cannot be met the type next in size must be chosen.
- 7.) If point 6 is not sufficient, choose one of the types next in size or ask for special types (questionnaire see page 17)

Above example for ordering: Sizes type 150, reduction 9:1, basic type construction up, spindle nose 2, stroke 2300mm, mounted vertical, with motor mounted on the right.

Additionally available options:

rigid protection expansion bellows spring steel spirals square locking device to prevent twisting three-phase A.C. motor with or without brake d.c. motor gear motor limit stop

overload clutch ball bearing spindle cardanplate oil lubrication

The required options must be added to the order ID or marked in the questionnaire.

### Elastic couplings (KU)

Finish-borings are made according, to the ISO system of tolerances H7. Feather key grooves are made according to DIN 6885/1. The max. angle shift is  $1^{\circ}30$ , the twisting angle  $3.2^{\circ}$  at M1 nom. The operable temperature range lies between  $-40^{\circ}\mathrm{C}$  and  $+100^{\circ}\mathrm{C}$

### Limit stop (EA)

### Safty nuts

Connected with the loaded traveling nut via driving pins, the locking nut runs at idle. As the threads in the traveling nut wear it approaches the idling, unloaded and therefore unworn safety nut. The wear is ascertained by checking the slot H. When the table entry H has declined by half the traveling nut must be replaced!

The visual check of the slot H can be automated by integrating an automatic disconnecting limit switch which is actuated when the raveling nut sinks.

# Mounting and Maintenance Instructions for Spindle gear BG2,5 - BG150

ENZFELDER GMBH
Power transmission- and
lifting engineering

A-2551 Enzesfeld-Lindabrunn Tel.: ++43 (0) 2256 81287-0 Fax: ++43 (0) 2256 81287-95 E-Mail: office@enzfelder.at Internet: www.enzfelder.at

### Mounting

Spindle gears must be mounted in true alignment on a flat surface which must be so stiff that it can assume the maximal load without oscillations or deformations. The alignment and correct positioning of the spindle gear must be done very carefully as no side forces should act on spindle and guide rings.

In lifting systems the spindle noses (in case of the basic type) or the traveling nuts (in case of the traveling nut type) must lie level with each other before the worms of the spindle gears are connected.

Before the driving gear is mounted the sense of rotation must be checked: in bevel gear driven lifting systems the sense of rotation can easily be confused; the result would be faulty mounting and possible damage of the installation.

Before putting it into service the spindle gear or the lifting system should be turned by hand once. If this requires non uniform forces the spindles are misaligned both to each other and to the installation. Adjustments are necessary; the fastening screws must be worked loose and the whole lifting gear must again be turned by hand. Spindles must be lubricated before being put into service; they are delivered non-greased!

Oil-lubricated worm gears: the upper screwed sealing plug must be replaced by the vent screw provided.

Attention! Misalignment and faulty gripping lead to increased power consumption, which is converted into friction and noise. The consequence is quick wear.

Additional add-on pieces: check under "Options".

If our specifications and performances according to the technical instructions are nor observed and/or the components are not used as prescribed, any warranty claims will no longer be applicable.

### **Maintenance**

Greases spindle and worm gear via lubricating nipple at regular intervals (~30-50 operating hours), clean and lubricate the spindle at the same time. The intervals depend on the given operating conditions and the duty cycle of the spindle gears. In case doubt please set up the lubrication plan together with us. The use of spindle spray increases the working life of the spindle and spindle nut. After approx. 200-300 operating hours the wear of the traveling nut or the worm wheel due to the backlash of threads should be checked. The maximal normal backlash of single trapezoid threads must not exceed 1/4 of the thread pitch. In the cases of multiple threads or special threads 1/4 of P is the maximum normal acceptable backlash. When the maximum normal backlash is reached the traveling nut or the worm wheel must be replaced. After a short run-in period all screws must be checked.

After approx. 500 operating hours we recommend cleaning gear and spindle to remove the grease, checking all piece parts as to wear, and recharging them with new grease.

Recommended lubricants: Shell Darina 2, Castrol Grease MS3, BP Energrease LS-EP2.

The lubricant recommended can be used both for gears and spindles. If a high-grade spindle lubricant is to be used, we recommend Klueberplex GE 11-680.

For special conditions (e.g. higher temperatures) we recommend the lubricants specified in the enclosed technical manual.

In case of possible dirt accumulation in or damage of the spindle, expansion bellows or spring steel spirals must beused to protect thespindle. For oil-lubricated gears please ask for a special service manual.

If you order spare parts the gear specifications marked on the type plate must be provided.

# Critical compressive force

Power transmission- and

lifting engineering Eichengasse 36 A-2551 Enzesfeld-Lindabrunn Tel.: ++43 (0) 2256 81287-0 Fax: ++43 (0) 2256 81287-95 E Mell: office@coxfelder.et

E-Mail: office@enzfelder.at Internet: www.enzfelder.at

Slender spindles subjected to compression are liable to buckle laterally. Befor defining the permissible compressive force acting on the spindle the safty factors applying to the lifting equipment must be taken into account.

F(kN) = axial force

= correction facto taking into account type of spindle bearing arrangement

 $F_{krit}$  (kN) = critical compressive force depending on free length L.

> = safty factor depends one use usual values between 3 and 6

## Additional forces acting on the spindle gear

# Power transmission- and

lifting engineering Eichengasse 36 A-2551 Enzesfeld-Lindabrunn Tel.: ++43 (0) 2256 81287-0 Fax: ++43 (0) 2256 81287-95 E Mell: effice@coxfelder et E-Mail: office@enzfelder.at Internet: www.enzfelder.at

### Lateral forces

When determining the lateral force acting on the spindle, possible forces resulting from the spindle moment M<sub>sp</sub> and, if the spindle is mounted horizontally, the dead weight must be taken into account. The diagram below illustrates the maximum permissible lateral force Fs depending on the free spindle length without any additional lateral quide.

### admissible leteral force Fs in N

### Spindle torque

The Spindle torge M<sub>SP</sub> is the torque acting on the various parts of the equipment via the spindle ends 3,4,6 or the running nut. The spindle torque can be calculated using the factor fm in the table below.

F(kN) = axial force

M (Nm) = torque of the elevating screw

= conversion factor including screw geometry and friction. The lower value applies under normal lubrication conditions, the higher value in case of dry friction and static friction.

$$F \times f_M = M_{sp}$$

|    | BG 2,5 | BG 5   | BG 10  | BG 25  | BG 50  | BG 100 | BG 150  |
|----|--------|--------|--------|--------|--------|--------|---------|
| fм | 1,12,6 | 1,53,1 | 1,63,4 | 2,45,1 | 3,06,8 | 4,09,3 | 4,310,1 |

# Additional forces acting on the spindle gear

# ENZFELDER GMBH Power transmission- and lifting engineering

Eichengasse 36 A-2551 Enzesfeld-Lindabrunn Tel.: ++43 (0) 2256 81287-0 Fax: ++43 (0) 2256 81287-95 E-Mail: office@enzfelder.at Internet: www.enzfelder.at

### Maximum driving torque

If the spindle gear is locking due to an obstacle, the maximum torques illustrated in Table 1 can still be picked up by the toothing at the transmission shaft.

In elevating equipment with serial spindle elevating gears the spindle gear next to the drive can transmit this moment via the transmision shaft.

|             | BG 2,5 | BG 5 | BG 10 | BG 25 | BG 50 | BG 100 | BG 150 |
|-------------|--------|------|-------|-------|-------|--------|--------|
| MT max (Nm) | 1,5    | 3,4  | 7,1   | 18    | 38    | 93     | 148    |

Tab. 1

### Forces and moments acting on the transmission shaft

If the spindle gears are driven via belts or chains, care must be taken to ensure that the arising thrust force is kept at a tolerable level. This thrust force is caused by the fact that the equipment is driven via a clutch not free from lateral force.

In this case Table 2 applies

In the worst case quick wear may occur, due to bending of the worm shaft the worm may be lifted from the worm wheel, which must be avoided.

|             | BG 2,5 | BG 5 | BG 10 | BG 25 | BG 50 | BG 100 | BG 150 |
|-------------|--------|------|-------|-------|-------|--------|--------|
| Fr max (kN) | 0,07   | 0,1  | 0,2   | 0,3   | 0,5   | 0,8    | 0,8    |

Tab. 2

### Required speed of the driving motor

The required speed of the driving motor is calculated from the proposed elevating speed, spindle gear ratio and the gear ratio of the transmission elements (e.g. bevel gears).

There may be serveral possibilities to reach a specific elevating speed.

### Choosing the driving motor

By determining the driving torque and choosing the speed the driving motor can be defined.

After chossing the driving motor the elevating equipment must be tested to avoid overload of the spindle gears or the transmission elements.

In elevating equipment with several spindle lifting gears uneven loading of the individual spindle gears may lead to overstrain.

To avoid this, elevating equipment should be protected with safety switches or torque-limited clutchs. Also, spindle gears should not be subjected to excessive vibration because the function of the automatic lock may no longer be guaranteed in such case. To avoid accidents brakes or brake motors should be integrated in the elevating equipment.

## Additional forces acting on the spindle gear

lifting engineering Eichengasse 36 A-2551 Enzesfeld-Lindabrunn Tel.: ++43 (0) 2256 81287-0 Fax: ++43 (0) 2256 81287-95 E Meli- office@ooxfelder at E-Mail: office@enzfelder.at Internet: www.enzfelder.at

### Required driving torque of a spindle gear

The required driving torque of a spindle gear is calculated from the axial load resting on the spindle, the transmission and the efficiency. Please bear in mind that the starting moment may be higher than the moment tequired during operation.

This applies particularly to spindle gears after a long standstill and to low-efficiency gears.

### Required driving torque of spindle elevating equipment

The required driving troque of spindle elevating equipment is calculated from the driving torques of the individual spindle gears, taking the arising friction losses in the transmission elements (clutches, propeller shaft, bevel gears,...) into account.

It is helpful illustrate the flux of forces in a sketch.

$$M_{\text{driving motor}} = M_{\text{T BG1 X}} \frac{1}{\eta_{\text{G1}}} + M_{\text{T BG2}} + M_{\text{T BG3}} \times \frac{1}{\eta_{\text{G2}}} \times \frac{1}{\eta_{\text{K}}}$$

 $M_{TBG1}$  = required driving torque spindle gear

= efficiency cardan shaft G1. Value around 0,75 to 0,95 **n** 61 depending on the number of pedestal bearings

ηĸ = efficiency bevel gear (only in case of flux via toothing, here between cardan shaft G1 and motor) value around 0.9

lifting engineering Eichengasse 36 A-2551 Enzesfeld-Lindabrunn Tel.: ++43 (0) 2256 81287-0 Fax: ++43 (0) 2256 81287-95 E Mail: office@confolder.ct E-Mail: office@enzfelder.at Internet: www.enzfelder.at

Please provide us with a sketch on the desired arrangement as shown above or according to your own ideas. Please enter the distance from spindle to spindle and possibly lateral guidings into the sketch. If you wish to receive an offer on spindle lifting elements actuated by multi-thread spindles or ball screw spindles, or if stainless material is desired, please let us know, too.

# Sketch

# Delivery programm

FREN Electric cylinders for lifting, lowering, pulling, pushing, sluing, or rotation Forces up to 1000kN Lifts up to 2500mm

FREN Resilient cardan shafts for transmitting torques with assembling inaccuracies Angles up to 3°
Torques up to 500Nm

FREN Planet gears in special designs for reducing speeds and increasing torques Gear reduction 1,5:1 up to 1500:1 Torques up to 1000Nm

FREN Cable winches for lifting, lowering, pulling or sluing
Forces up to 300kN
Lifts up to 100000mm

FREN Spindle gear for lifting, lowering, pulling, pushing, sluing, or rotating Forces up to 3000kN
Lifts up to 10000mm

FREN Bevel gears 'K' and Bevel gears cubic 'H' for deflecting imput shafts Speeds up to 6500U/min Torques up to 5200Nm

FREN Telescopic gears and telescopic cylinders for lifting, lowering, pulling, pushing Forces up to 1000kN Lifts up to 10000mm

FREN Scissor-type lifting platforms for lifting and lowering including a wide range of accessories Forces up to 500kN
Lifts up to 5000mm
